

ABSTRACT

A composition for nasal or buccal application comprising a distribution of multilayer microparticles in an inactive base, at least one ingredient having
5 activity on the mucosa of the nose/ throat, being adsorbed within the layers of the microparticles so as to be progressively released over time in use; a method for the preparation of the composition for the controlled delivery of an active ingredient over time *in situ* at the mucous membranes of the nose or throat of a human, non-human mammal or other animal comprises the steps
10 of:
microencapsulating at least one ingredient having activity on the mucosa of the nose/ throat within or on the layer surfaces of a multilayer microparticle;
distributing the ingredient within a suitable base material serving as a means to deliver the microspheres to the active site for example suspending in a liquid
15 base or distributing in a soluble solid base;
a method of delivering an active ingredient to the nose or throat of a human, non-human mammal or other animal subject for controlled release over time *in situ* at the mucous membranes of the subject comprises the steps of:
administering the composition to the subject in such manner that the
20 microparticles are directed towards a desired site on the mucus membrane of the subject;
the use of the composition or active microparticle in progressive delivery of an active ingredient; or
a novel active microparticle.
